

Sr. Elite Mask mounting instructions & options.

Optional mounting for better fit, vision & airflow.

The Sr. Elite mounts with the mounting clips on the mask facing upward or downward offering optional fit so the lens is not below the nose and mouth. Two stainless steel screws are provided to screw the mask to the helmet. You want the lens to be at or above the nose so you breath straight through the lower cage frame for better airflow. The interior lens anti-fog coating works to dissipate condensation. Wipe between shifts as necessary.

The chin cup can be looped around the lower two horizontal bars (see left picture) or floating see (right picture). Make sure its snug to your chin.

The strap assembly and snaps are to affix to fit the mask to your chin and the back sides of the helmet. See below.

1. Snaps to affix the lower mask to the helmet
2. Male post to snap mask to helmet
3. Adjust the lower mask to chin and snap to helmet before play.

Product information and warnings: After any impact check the mask thoroughly. If cracked, dented or broken do not use and replace the mask or damaged part. The lens is replaceable. Remove the two screws and lift the lens over the inside mask tabs with a small screw driver lift and push the lens out. The lens coated both sides with Anti-fog and scratch resistant coatings. It is not scratch proof. But with care it should last depending on wear. See Product care on website for instructions.

Important: Check all screws on the mask and helmet regularly and inspect helmet and mask to insure proper fit and in working order. Do not over tighten screws. If you have any questions contact us or your local hockey shop.

Hockey is a dangerous sport and serious injuries and death can occur. The mask is not to be used to block shots as if you were a goalie. The mask is HECC approved.
